GENERAL INFORMATION:
APPLICANT: Schmidt, Robert R.
APPLICANT: Miller, Philip
TITLE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLECTIDES
TITLE OF INVENTION: RELATING TO THE '- AND -SUBUNITS OF GLUTAMATE
TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF USE
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Saliwanchik & Saliwanchik
STREET: 2421 N.W. 41st Street, Suite A-1
CITY: Gainesville

Sequence 26, Application US/08828451
Setent No. 5985634
GENERAL INFORMATION:
APPLICANT: Schmidt, Robert R.
APPLICANT: MILLS PHILIP
TITLE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLEOTIDES
TITLE OF INVENTION: RELATING TO THE - AND -SUBUNITS OF GLUTAMATE
TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF USE
NUMBER OF SEQUENCES: 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: Saliwanchik & Saliwanchik
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

A42489
glutamate dehydrogenase (NADP) (EC 1.4.1.4) - Giardia lamblia
NyAlternate names: glutamic dehydrogenase; NADP-specific glutamate dehydrogenase
C;Species: Glardia lamblia
C;Accession: A42489
R;Yee, J.; Dennis, P.P.
J. Biol. Chem. 267, 7539-7544, 1992
A;Title: Isolation and characterization of a NADP-dependent glutamate dehydrogenase gene
A;Reference number: A42489; MUID:92218410; PMID:155991
A;Rocession: A42489
A;Molecule type: DNA
A;Residues: 1-449 < YYEB-

Transforming a plant with a polynucleotide encoding a polypeptide with glutamate dehydrogenase activity provides a plant with modulated nitrogen metabolism useful to increase yield and ammonium and osmotic stress

Claim 7; Page 27-28; 35pp; English.

The invention relates to a method of modulating nitrogen metabolism in plant cells, comprising transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenase activity, and culturing the cell to produce descendant cells which express the polypeptide. The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammoniatoricity, improved osmotic stress tolerance and improved composition. The present sequence represents the amino acid sequence of Chlorella sorokiniana mature NADP-glutamate dehydrogenase alpha subunit, used in

The present invention relates to increasing or decreasing the nitrogen metabolism in plant cells by transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenase (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH ADD36707, ADD36729, a beta subunit of NADP-specific GDH ADD36711), or their fragments, which exhibits GDH activity. The polynucleotide is operably linked to a polynucleotide encoding a chloroplast transit peptide comprising ADD36710 or ADD36711, or their fragments that exhibit chloroplast transit activity. The method is useful for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polynucleotides, and polypeptides are useful in producing plant with increased yield, and with improved tolerance to ammonia toxicity, osmotic stress, and composition of the crop or plant. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360

The invention relates to a method of modulating nitrogen metabolism in plant cells, comprising transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenase activity, and culturing the cell to produce descendant cells which express the polypeptide. The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the amino acid sequence of Chloralia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transforming a plant with a polynucleotide encoding a polypeptide with glutamate dehydrogenase activity provides a plant with modulated nitrogen metabolism useful to increase yield and ammonium and osmotic stress
                                                                                                                                                                                                    GLEMTQNRMSLAWTREEVRDKLERIMKDIYDSAMGPSRRYNVDLAAGANIAGFTKVADAV 506

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2 Polypeptides (AAW15407 and AAW15408) respectively comprise the alpha (AAW15407) and beta subunit (AAW15408) precursor proteins of an ammonium-inducible, chloroplast-localised NADP-specific glutamate dehydrogenase inducible, chlorolas sorokiniana. They are processed to mature alpha and beta subunits (see also AAW15411-12) that comprise the active NADP-GDH hexameric isoenzymes. The N metabolism of plants can be modulated (pref. increasing the assimilation of inorganic N into organic N) by transforming them with nucleotide sequences (see also AAT64529-30, AAT64547-48) encoding the alpha and/or beta subunits or precursor and improved stress tolerance. Heterohexamers having alpha and beta subunits can be expressed that have higher aminating deaminating activity (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     146
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             241

The present invention relates to increasing or decreasing the nitrogen metabolism in plant cells by transforming a plant cell with a polynocleotide encoding a polypeptide having glutamate debytosgenase oplynocleotide encoding a polypeptide is an alpha subunit of NaDP-specific GDH (ADQ36719), a beta subunit of NaDP-specific GDH (ADQ36719), or their fragments, which exhibits GDH activity. The polynucleotide is operably linked to a polynucleotide encoding a chloroplast transit peptide comprising ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is useful for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polynucleotides, and polypeptides are useful in producing plant with increased yield, and with improved tolerance to ammonia toxicity, sequence is the precursor protein of the crop or plant. The present sequence is the precursor protein of the beta subunit of the NADP-specific GDH, which is then processed to produce the mature alpha subunit of the NADP-specific GDH, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    146

The invention relates to a method of modulating nitrogen metabolism in plant cells, comprising transforming a plant cell with a polynucleotide encoding a polypeptide having glutamate dehydrogenase activity, and culturing the cell to produce descendant cells which express the polypeptide. The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the amino acid sequence of Chlorella sockiniana NADP-glutamate dehydrogenase alpha subunit, used in the
